Lab 7 Report

Task 1 Baseline:

Task 2 Fine Tuned:

Results:

Based on our results, the model we had in task 1 was better at identifying gestures than the model we had in task 2. Our model in task 2 was way too overtrained and thought every gesture was a 3. This is most likely a result of bad training data on our part. We were using a shorter USB cable so it was difficult to get good stroke patterns. Model 1 performed better because the training data it had was cleaner.

Fine tuning did not help with specific gesture styles and actually made it worse. This is most likely a result of bad data due to our data collection technique. To further improve this model we would have to use a longer USB cable so that we can get cleaner strokes, as well as get better stroke data.
